The LaTeX macro package tmmaths

Walter Schmidt

(v1.2 – 2000/04/15)

Contents

1 Usage **1**
1.1 Font encoding 1
1.2 The `slantedGreek` option 1

2 Availability and support **1**

1 Usage

The LaTeX macro package tmmaths supports typesetting with the well known 'Times' fonts, using Adobe Times and MicroPress TM-Math (v1.2). TM-Math extends Adobe Times with math and text companion symbols needed by TeX. Simply loading the package

```
\usepackage{tmmaths}
```

makes LaTeX use the Times and TM-Math fonts for text and math, with the default roman font family (`\rmdefault`) changed to `tmr`

1.1 Font encoding

The package does *not* change the default output font encoding from OT1. It is, however, recommended to make use of the font family `tmr` through the extended T1 and TS1 encodings, so as to provide access all glyphs. This is enabled by the following additional commands:

```
\usepackage[T1]{fontenc}
\usepackage{textcomp}
```

1.2 The `slantedGreek` option

When the macro package is loaded using the option `[slantedGreek]`, uppercase Greek letters will, by default, be slanted. Regardless of the option the new commands `\upDelta` and `\upOmega` will *always* provide an upright Δ and Ω.

2 Availability and support

The latest version of this package can be obtained from the directory `macros/latex/contrib/supporte` of any CTAN host, e. g. `<ftp://dante.ctan.org/tex-archive/>`.
The TM-Math fonts are provided by

MicroPress, Inc.
6830 Harrow Street
Forest Hills NY 11375
USA
