# What happens in auto?

Monday, September 19, 2011

Usually, a sensor sits just under the mirror of your camera and measures the intensity

# ISO?

Monday, September 19, 2011

ISO = Hardware gain

**200 ISO**

- Daylight
- Bright, bright studio lighting

## **400-1600 ISO**

- Outdoors, action shots
- Indoors, adequate lighting
- Shade

## 3200+ ISO

- Indoors, poor lighting
- Indoors, action shots
- Night time (+ some software gain)

Monday, September 19, 2011

This is cool, why not keep 3200+ ISOs all the time?

Well...for one having a waaay too sensitive sensor in broad daylight can oversaturate it and possibly destroy it.

**3200+ ISO**

**More noise**

**200 ISO**

**Less noise**

# Shutter Speed?

Monday, September 19, 2011

Demo slow and fast shutter speeds

# **B** Bulb.

Stays on for as long as you press the shutter button.

# T

## Time.

Keeps the shutter open when you press the shutter button once. Closes the shutter when you press the button a second time.

**speeds  $\leq 1/1000$  s**

Captures fast action. Needs a lot of light.

**$1/60 \text{ s} \geq \text{speed} > 1/1000 \text{ s}$**

Medium action. People walking.

**$1/2 \text{ s} \geq \text{speed} > 1/60 \text{ s}$**

Tripods become necessary, especially with shaky hands. Not really enough to capture too much of motion trail, just motion blur.

**speed  $\geq 1''$  s**

Longer motion trails. Needs an area with less light,  
or a small aperture.

1/1250 sec

# Color Temperature (K) & White Balance

Monday, September 19, 2011

When we think of color temperature, we first look to all the various color temperatures that can be found naturally.

By definition, color temperature of a light source is the temperature of an ideal black-body radiator that radiates light of comparable hue to that of the light source. Hence, color temperature is stated in the unit of kelvins.

Blue Sky	<b>10 000 K</b>
	<b>9 000 K</b>
Partly Cloudy	<b>8 000 K</b>
	<b>7 000 K</b>
Overcast / Haze	<b>6 000 K</b>
Noon Daylight Direct Sun	<b>5 000 K</b>
	<b>4 000 K</b>
Late Sunrise Early Sunset	<b>3 000 K</b>
	<b>2 000 K</b>
Early Sunrise Late Sunset	<b>1 000 K</b>

# **camera vs. eye**

**10 000 K**  
**9 000 K**  
**8 000 K**  
**7 000 K**  
**6 000 K**  
**5 000 K**  
**4 000 K**  
**3 000 K**  
**2 000 K**  
**1 000 K**

**Tungsten**  
**(Incandescent)**

**cooler**

**warmer**

Monday, September 19, 2011

Tungsten lighting (more commonly known as incandescent lighting)...is lighting based on heat. It puts off a very warm yellowish glow, just like a late sunrise or early sunset. It's very cosy. We barely notice this glow. However, when you point a camera that's improperly white balanced for the scene, you may get a very unwanted yellowish glow.

Bulbs based on heat (tungsten lamps) – incandescent light – have for a long time been (and still is) the most common source of light in our homes. We are so accustomed to the warm yellowish light created by these lamps that we perceive it as fairly white. But our camera records the yellow color cast as it is. This is sometimes desirable, as it creates a warm, cosy effect. But more often this effect is not what we want, forcing us to adjust the white balance accordingly. As this kind of light is based on heat, the color temperature in the Kelvin temperature scale is pretty low; between 2500K-2900K (not unlike sunlight at sunrise and sunset).

**10 000 K**  
**9 000 K**  
**8 000 K**  
**7 000 K**  
**6 000 K**  
**5 000 K**  
**4 000 K**  
**3 000 K**  
**2 000 K**  
**Candlelight** **1 000 K**

Monday, September 19, 2011

Even warmer is the light emissions from flames, like candlelight or a fireplace. The white balance setting for tungsten usually works well with candle-lit interiors, but as the temperature of candlelight is just below 2000K, even more adjustment may be warranted.

Monday, September 19, 2011

Older Fluorescent lighting has a sort of green tint to it. Newer fluorescent lights now can span a whole range of different color temperatures.

**10 000 K**

**9 000 K**

**8 000 K**

**7 000 K**

**6 000 K**

**5 000 K**

**4 000 K**

**3 000 K**

**2 000 K**

**1 000 K**

**cooler**

**Sodium Lights**  
(street lamps)

**warmer**

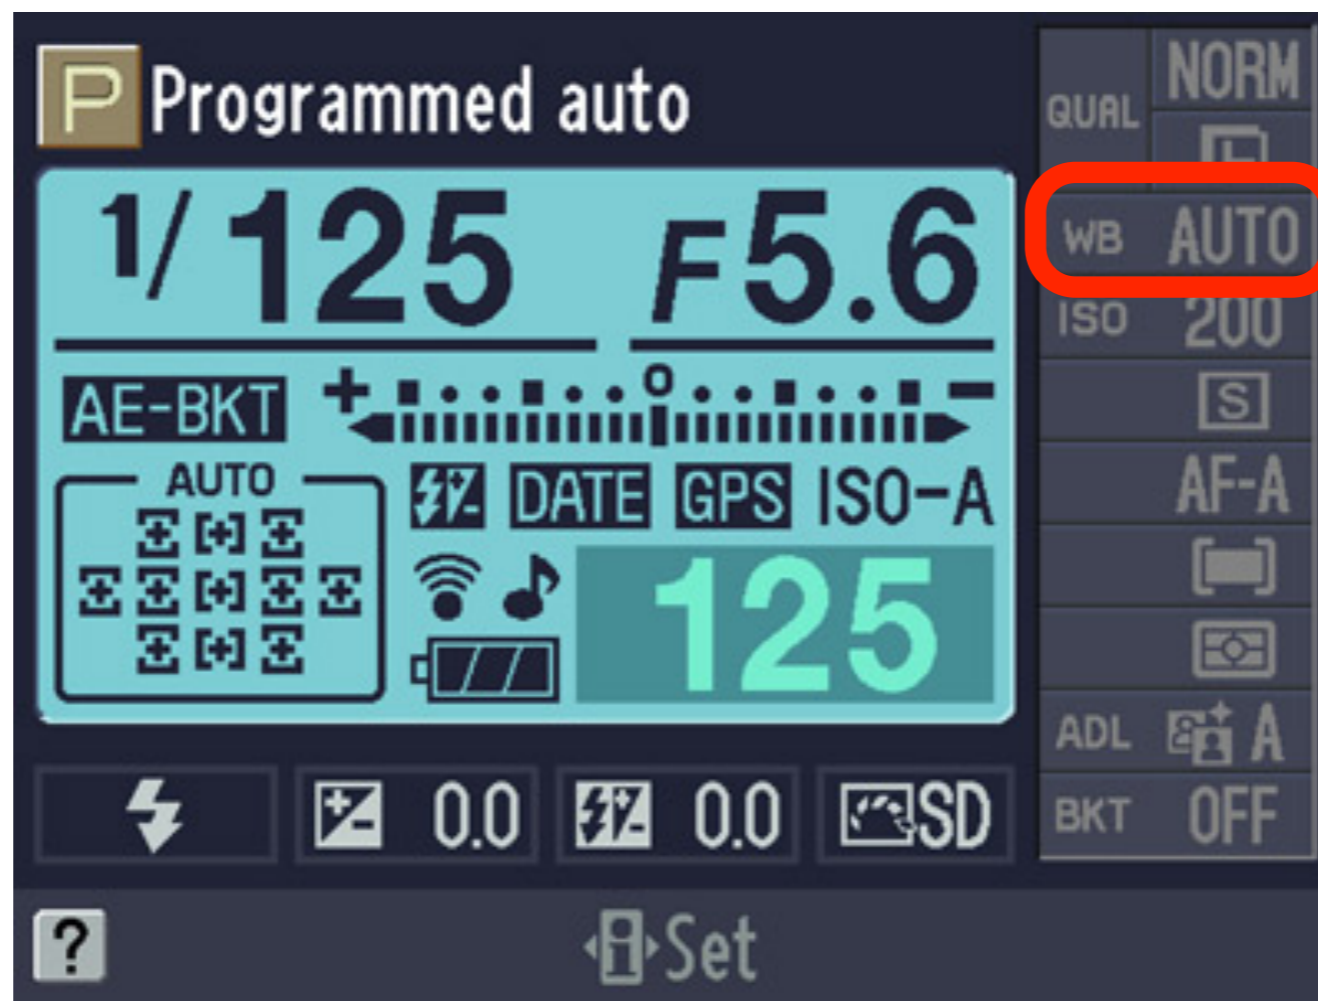

# White balance

Monday, September 19, 2011

To the human eye, a white object looks white regardless of the type of lighting. With a digital camera, the color temperature is adjusted with software to make the white areas look white. This adjustment serves as the basis for the color correction. The result is natural-looking colors in the pictures.

**let's change our white balance!**

**WB button**

**Main command dial**

**Control panel**

Monday, September 19, 2011

Nikon

TOP (entry)

Bottom (midlevel)

Option	Color temp. (K)	Description
<b>A</b> Auto (default)	3,500– 8,000*	Camera sets white balance automatically; recommended in most situations. For best results, use type G or D lens. If built-in or optional flash is used, white balance reflects conditions in effect when flash fires.
 <b>Incandescent</b>	3,000*	Use under incandescent lighting.
 <b>Fluorescent</b>		Use with the following seven light sources:
<b>Sodium-vapor lamps</b>	2,700*	Use under sodium-vapor lighting (found in sports venues).
<b>Warm-white fluorescent</b>	3,000*	Use under warm-white fluorescent lights.
<b>White fluorescent</b>	3,700*	Use under white fluorescent lights.
<b>Cool-white fluorescent</b> (default for <b>Fluorescent</b> )	4,200*	Use under cool-white fluorescent lights.
<b>Day white fluorescent</b>	5,000*	Use under daylight white fluorescent lights.
<b>Daylight fluorescent</b>	6,500*	Use under daylight fluorescent lights.
<b>High temp. mercury-vapor</b>	7,200*	Use under high color temperature light sources (e.g. mercury-vapor lamps).
 <b>Direct sunlight</b>	5,200*	Use with subjects lit by direct sunlight.
 <b>Flash</b>	5,400*	Use with built-in or optional flash.
 <b>Cloudy</b>	6,000*	Use in daylight under overcast skies.
 <b>Shade</b>	8,000*	Use in daylight with subjects in the shade.
 <b>Choose color temp.</b>	2,500– 10,000	Choose color temperature from list of values (pg. 99).
<b>PREPreset manual</b>	—	Use subject, light source, or existing photograph as reference for white balance (pg. 100).

Since there is no critical point of transition, a more rigorous term called the "**circle of confusion**" is used to define how much a point needs to be blurred in order to be perceived as unsharp. When the circle of confusion becomes perceptible to our eyes, this region is said to be outside the depth of field and thus no longer "acceptably sharp." For CCD cameras, d of circle of confusion is between 0.01 and 0.005 mm.

Monday, September 19, 2011

For CCD cameras, d of circle of confusion is between 0.01 and 0.005 mm.

Monday, September 19, 2011

Since there is no critical point of transition, a more rigorous term called the "**circle of confusion**" is used to define how much a point needs to be blurred in order to be perceived as unsharp. When the circle of confusion becomes perceptible to our eyes, this region is said to be outside the depth of field and thus no longer "acceptably sharp." For CCD cameras, d of circle of confusion is between 0.01 and 0.005 mm.
