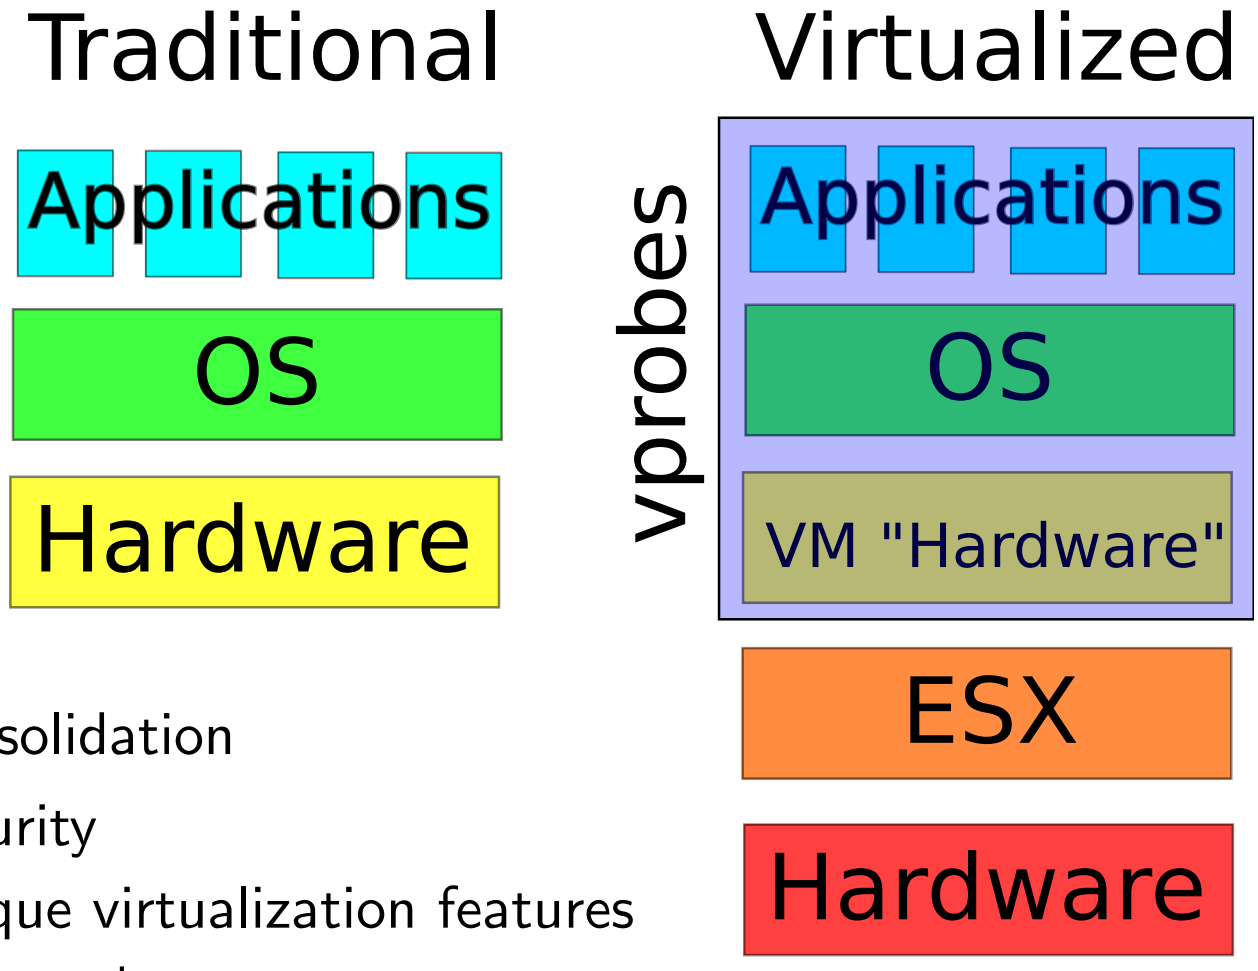
Possible application: Proof of identity

- Numerous cases where you want to prove who you are
- Example: authorize a credit card transaction
- Don't want stores to be able to charge you for more stuff later
- Use zero-knowledge proof to prove who you are, instead of a credit card number you keep secret

Virtualization



- Consolidation
- Security
- Unique virtualization features
  - vprobes

Idea of the construction of $\mathbf{p}_k(n)$, cont

Let $f(n,k)$ be the probability that $k \mid (a+b)$ and $(b+c)$ for a random *abc*-permutation of length n.

Lemma (Pak-Redlich, 2008)

$$f(n,k) = \begin{cases} \frac{\left(\frac{n}{k}+1\right)\left(\frac{n}{k}+2\right)}{(n+1)(n+2)} & \text{if } k \mid n \\ \frac{\lfloor \frac{n}{k} \rfloor \left(\lfloor \frac{n}{k} \rfloor + 1\right)}{n(n+1)} & \text{if } k \nmid n. \end{cases}$$

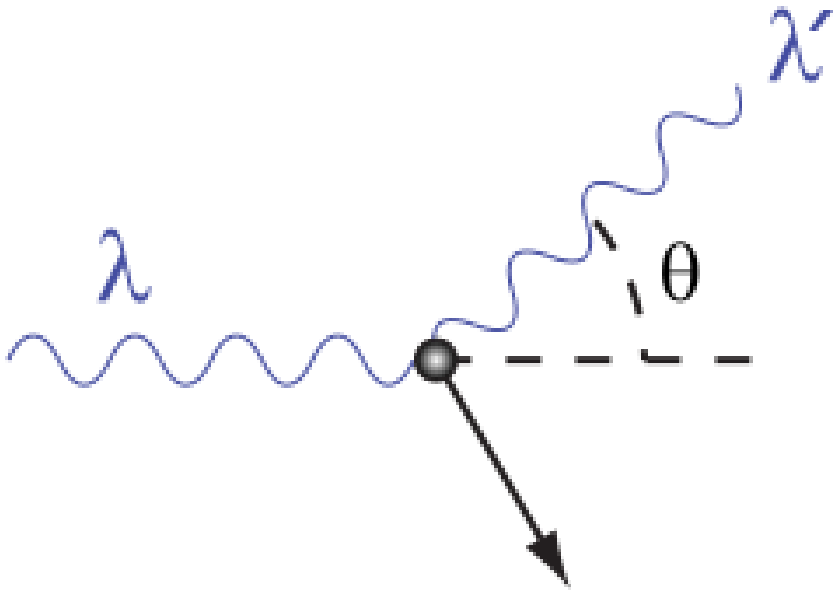
PLAYING IN THE SANDBOX

David Benjamin

Process Isolation in Google Chrome

Compton Scattering Theory

- Billiard-ball style collisions
- Relativistic energy: $E^2 = p^2c^2 + m^2c^4$



$$\Delta\lambda = \frac{h}{mc}(1 - \cos\theta)$$

Calculating the Cross-Section

- Uniform gas density $\rightarrow$ constant scattering probability for a fixed distance

$$I = I_0 \, e^{-\frac{L}{\lambda}}$$

$$\frac{1}{\lambda} = n\sigma$$

$$\sigma(V) = \frac{1}{nL} \ln\left[\frac{I_0(V)}{I(V)}\right]$$

Amplitude Results

- Classically-expected increase for large θ not observed
- Large systematic errors
  - Unusually weak signal at 30° — likely discriminated against
  - Scintillator efficiency
  - Detector drift
- Errors too significant to verify Klein-Nishina; however data definitely inconsistent with Thomson model

Idea of the construction of $\mathbf{p}_k(n)$

Let A_k be the event that $k|(a+b)$ and $(b+c)$, and let B_k be the event that $(a+b)/k$ and $(b+c)/k$ are relatively prime integers. Then

$$\mathbf{p}_k(n) = Pr(A_k) \cdot Pr(B_k \text{ given } A_k)$$

Explanations–Classical and Quantum

In 1887 Hertz observes a new phenomena

No classical explanation exists

In 1905 Albert Einstein proposes a quantum explanation

$$E_{photon} = h\nu \qquad KE_{max} = h\nu - \Phi$$

Ideas from the classification of cycle structure

First, note that if $x \leq c$, we have

$$\sigma_{abc}(x) = x + a + b.$$

For ease of notation, let $d = c - a$. If $c < x \leq b + c$, we have

$$\sigma_{abc}(x) = x - d,$$

and if $x > b + c$, we have

$$\sigma_{abc}(x) = x - a - b.$$

Zero-Knowledge Proofs

Showing you *can* do something, without showing how

Alex Dehnert

6.UAT

Fall 2011

What's new?

- Intrusion detection based on syscalls *isn't* — plenty of people have done that
- However, generally, that's vulnerable to attacks against the agent
- So, develop a version that gathers data using vprobes

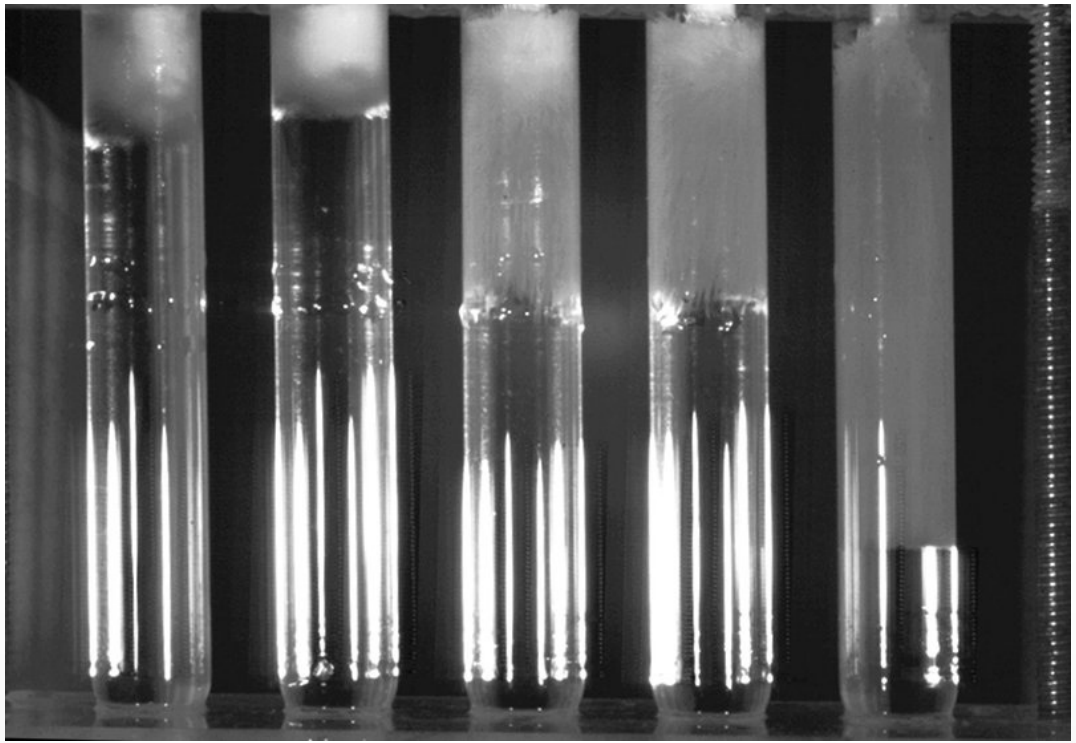
Massachusetts Institute of Technology

High Speed Crystallization of Sodium Acetate



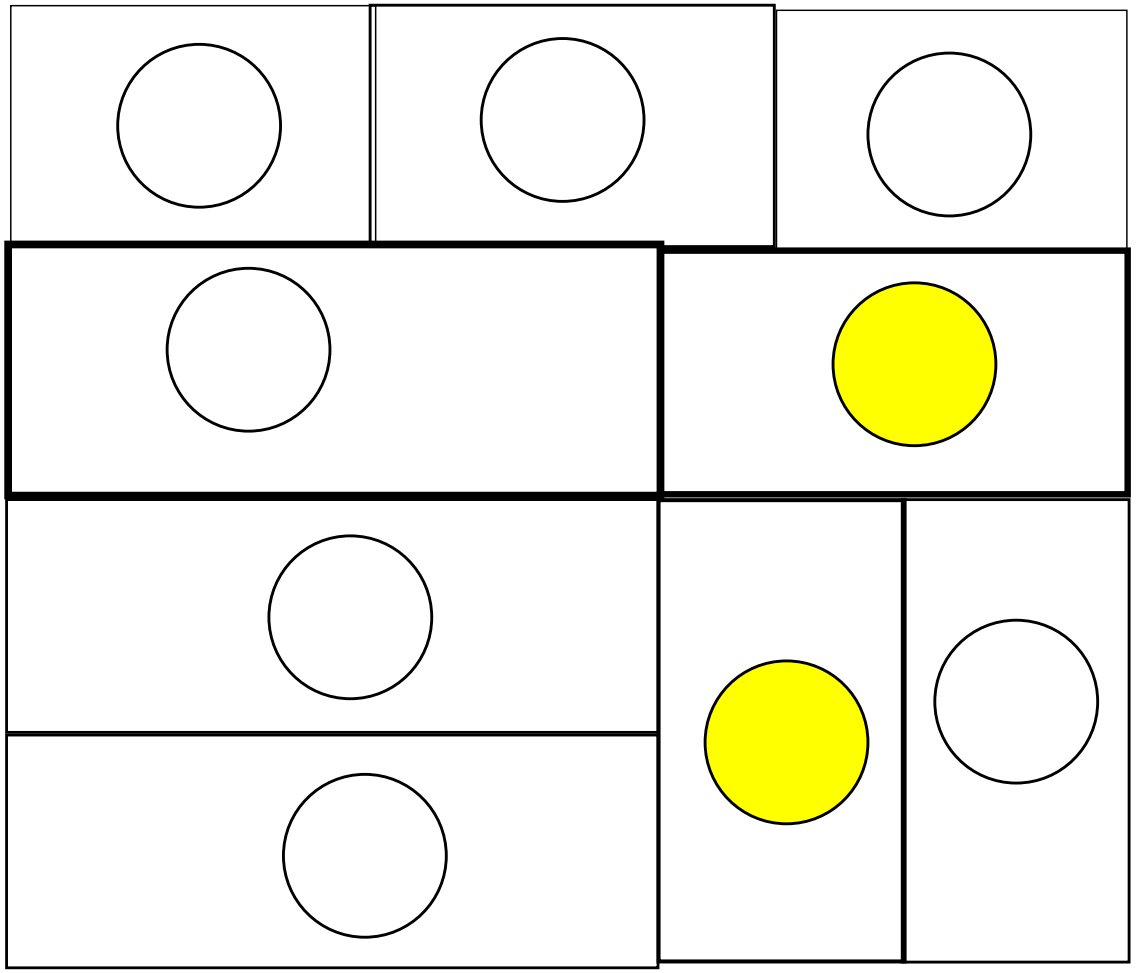
Robin Deits, **Sally Wolfe**, Daniel Ron, Bayo Olatunji

Improvements and Extensions

- More stable probe setup to allow more accurate determinations of field strength
- Greater sensitivity to allow use of higher concentrations
- Removing dissolved oxygen

Map coloring ZKP

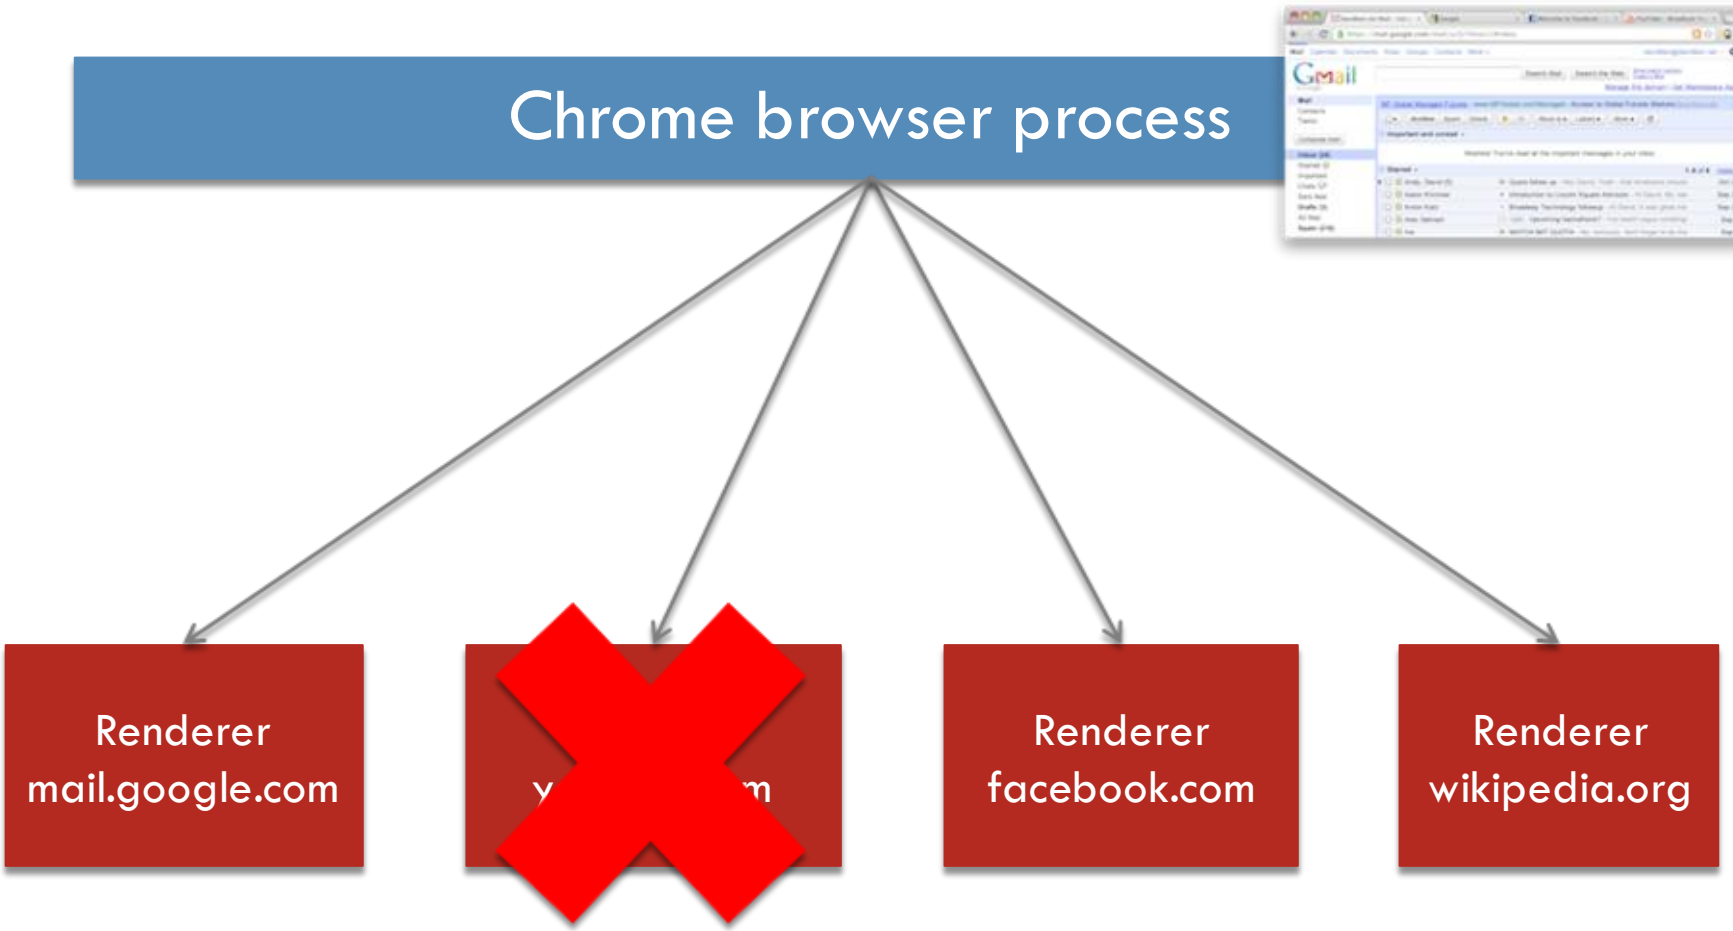
Challenge



Matter Waves and Interference

- Electrons and atoms cannot be treated as billiard balls
- Objects are diffuse, described by a wave function
- Interference between wave functions can produce unexpected effects
- Ramsauer-Townsend: $\sigma = 0$ for a particular energy

Multi-process browsing



Why bother?

- Crashes mean browser bugs
- Why not just write correct code?

5,000,000

Principle of least privilege

Each component of your system should have only the rights it needs and no more

- Limit damage when things go wrong
- Fewest privileges to parts most likely to fail

Avenues for further research

1. What is the cycle structure of layered permutations?
2. What is the structure and number of permutations which avoid 132, 213, and another permutation of length at least four?

Einstein's theory

- Planck's quantized oscillators
- Photons, with $E = h\nu$
- Intensity $\equiv$ number of photons
- One photon, one electron

$\Downarrow$

- Energy of emitted electrons independent of intensity
- Energy dependent on frequency
- Minimum cutoff frequency

Nuclear Magnetic Resonance: Effect of Paramagnetic Ions on Relaxation Times

Daniel J. Fremont

8.13 — Junior Lab
Massachusetts Institute of Technology

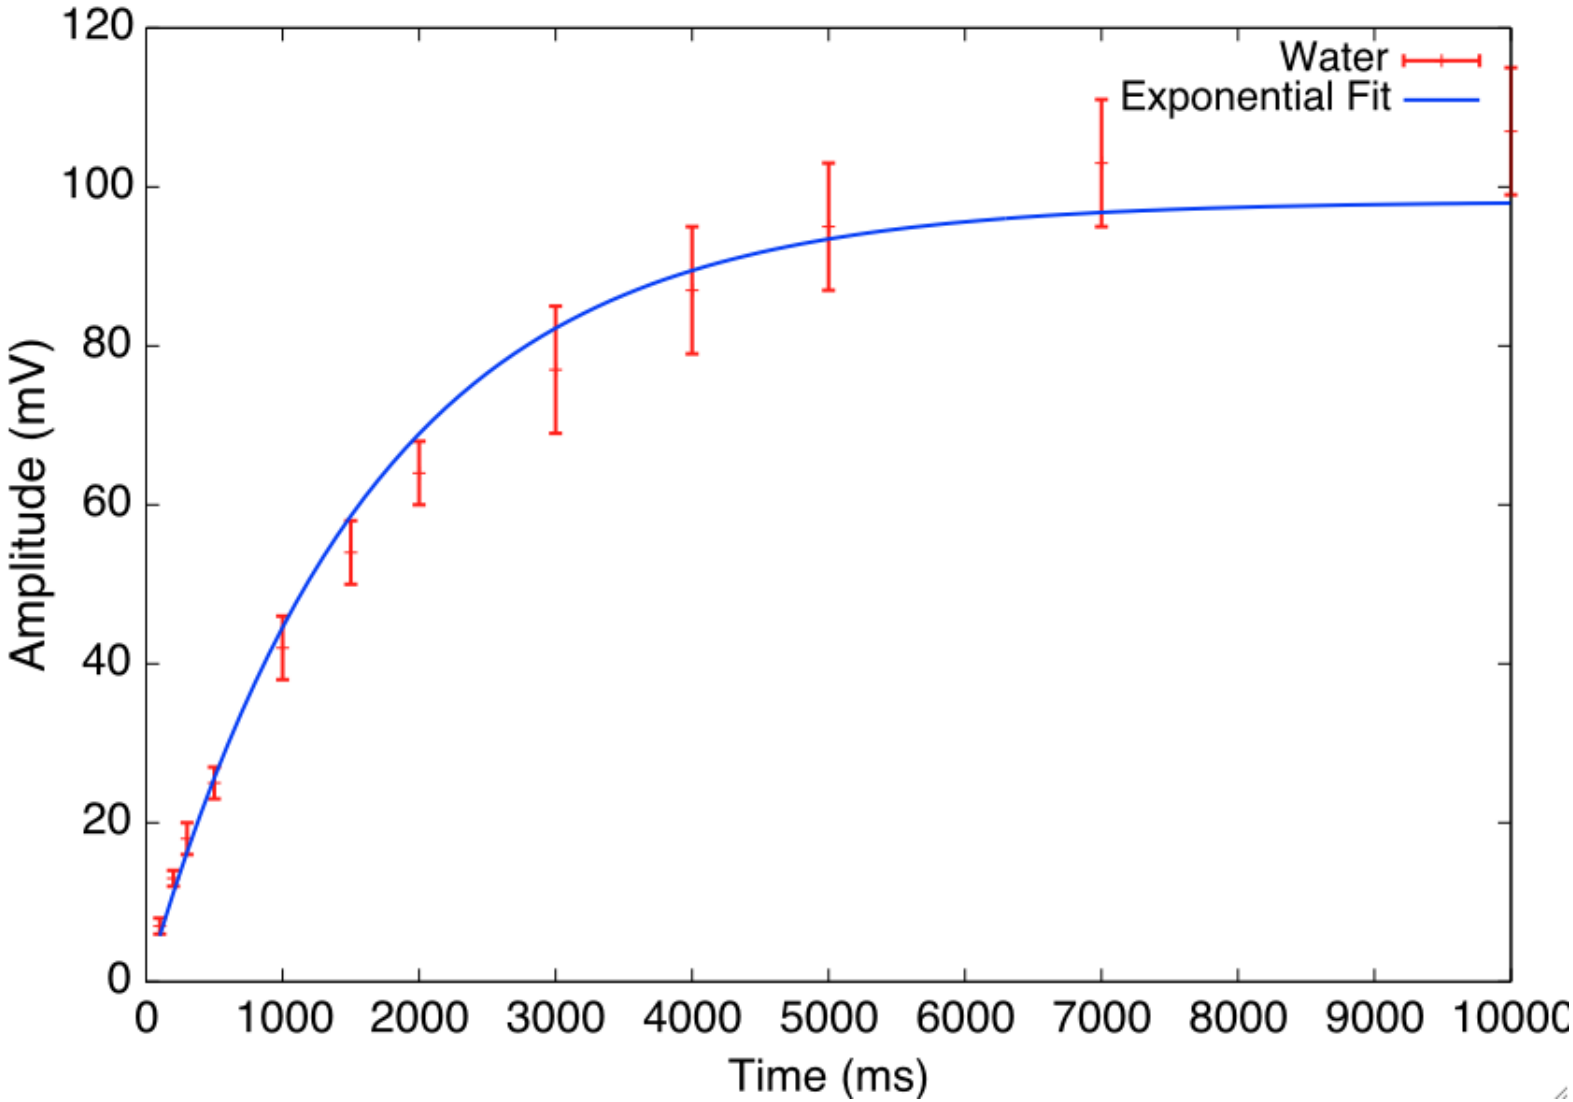
Definition of $\mathbf{p}_k(n)$

Since

$$\mathbf{p}(n) = 1 - \sum_{s=2}^{n} \mu(s) f(n, s),$$

we have

T1 Measurement



$$T1 = (2108 \pm 240)ms \qquad \chi_r^2 = 1.13$$

Avenues for further research

1. What is the cycle structure of layered permutations?

Results

- Proton magnetic moment: $(1.424 \pm 0.083) \cdot 10^{-26}$ J/T
  - Accepted value: $1.411 \cdot 10^{-26}$ J/T
- $\frac{1}{T1}$ grows linearly with Fe^{3+} concentration
- $\frac{1}{T2}$ grows faster than linearly with Fe^{3+} concentration

Results

- Minimum σ occurs at $0.53 \pm 0.077\ V$
  - Significantly off from true value of 0.9 V
- Random errors insufficient
- Systematic errors
  - Contact potential
  - Nonzero initial electron energy
  - Unequal filament temperatures
- Corrected value: $0.88 \pm 0.092\ V$

Reverse layered permutations

Definition

A permutation ϕ is called reverse layered if it is of the form $q_1 q_2 \dots q_k$, where the q_i are strings of consecutively increasing numbers and $q_i > q_j$ if $i < j$.

abc-permutations

Definition

Let *abc*-permutations be elements of S_n obtained by partitioning $[n]$ into three blocks of length a, b, c and exchanging the first and last blocks.

Examples

Pattern avoidance and *abc*-permutations

Theorem

The set of abc-permutations is the set of permutations which avoid 132, 213, *and* 4321.

In order to prove this theorem we make use of the fact that *abc*-permutations are *reverse layered permutations* with three or fewer layers.

What if Peggy cheats?

- Victor stands outside at P
- Peggy picks R or S to hide at
- Victor comes back in, stands at Q, and calls out which side Peggy should return by
- If Peggy picked the correct side, she tricks Victor; otherwise, she has to admit she lied
- If Victor does this enough times, Peggy will guess wrong (one trial, 50% she succeeds; two trials, 25%; etc.)

Definition of $\mathbf{p}_k(n)$

Since

$$\mathbf{p}(n) = 1 - \sum_{s=2}^{n} \mu(s) f(n, s),$$

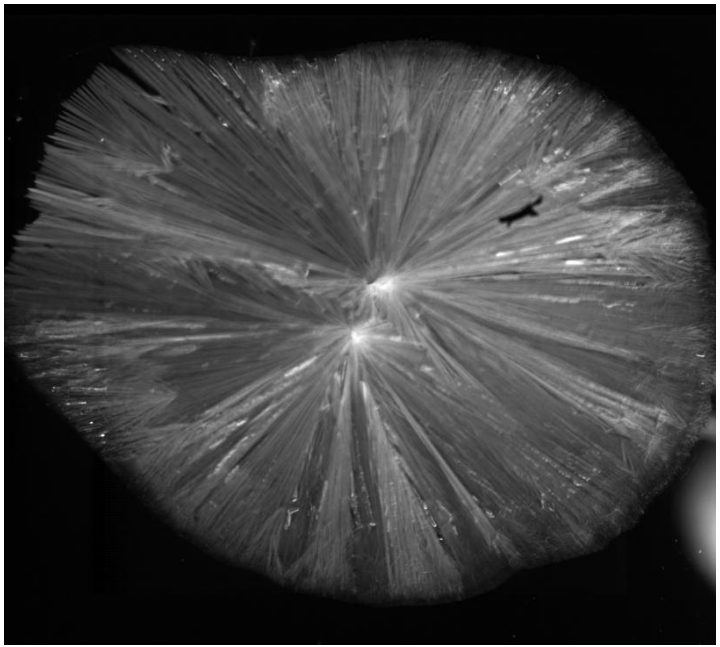
we have

Theorem

$$\mathbf{p}_k(n) = \begin{cases} f(n,k)(1 - \sum_{s=2}^{n/k} \mu(s) f(n/k, s)) & \text{if } n \mid k \\ f(n,k)(1 - \sum_{s=2}^{n/k} \mu(s) \Gamma(n/k, s)) & \text{if } n \nmid k \end{cases}$$

where $\Gamma(n,k)$ *is a similar function to* $f(n,k)$.

High Speed Crystallization



Crystallization of supersaturated Sodium Acetate solution from below. The two points of emanation caused by two seeds are clearly visible. Shot at 1000 fps, f/8, 90mm lens.

Idea of the construction of $\mathbf{p}_k(n)$, cont

Then

$$\mathbf{p}_k(n) = f(n,k) \cdot Pr(B_k \text{ given } A_k).$$

If $n \mid k$, we have that $k \mid (a+b)$ and $(b+c)$ implies that $k \mid a, b, c$. Then choosing the blocks a, b, c partitioning n is equivalent to choosing blocks $a/k, b/k, c/k$ partitioning n/k.

Discussion: moving forward

With sodium acetate:

- vary temperature/concentration, look at linear crystallization speed (see 1957 paper)
- look at types/processes of crystallization

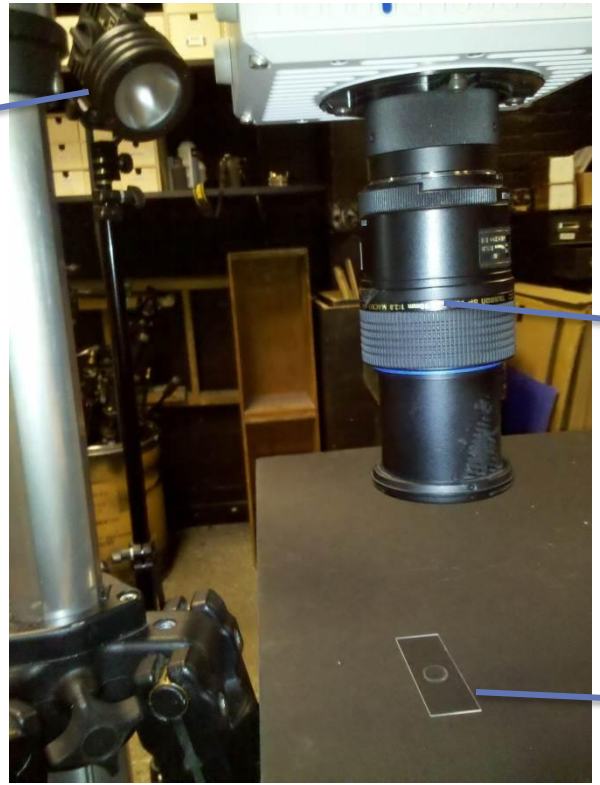
Google PageRank

- Internet contains N web pages
- Page contains k links
- Follow a link or type a URL
- Model as a Markov chain
- What pages do users end up on?
- Higher ad prices, earlier search results

History of NMR

- Rabi (1937) predicts and first observes NMR
- Purcell and Bloch (1945) measure relaxation times and their dependence on chemical properties
- Chemical shifts discovered (1950-1)
- Lauterbur (1973) applies NMR to medical imaging

Procedure: overhead setup



Discussion: conclusions

- Sodium Acetate is feasible
  - Crystallizes consistently and on recordable time scales

- Bismuth isn't feasible
  - Crystallization isn't happening on time/physical scales we have the techniques to record

Ideas from the classification of cycle structure, cont

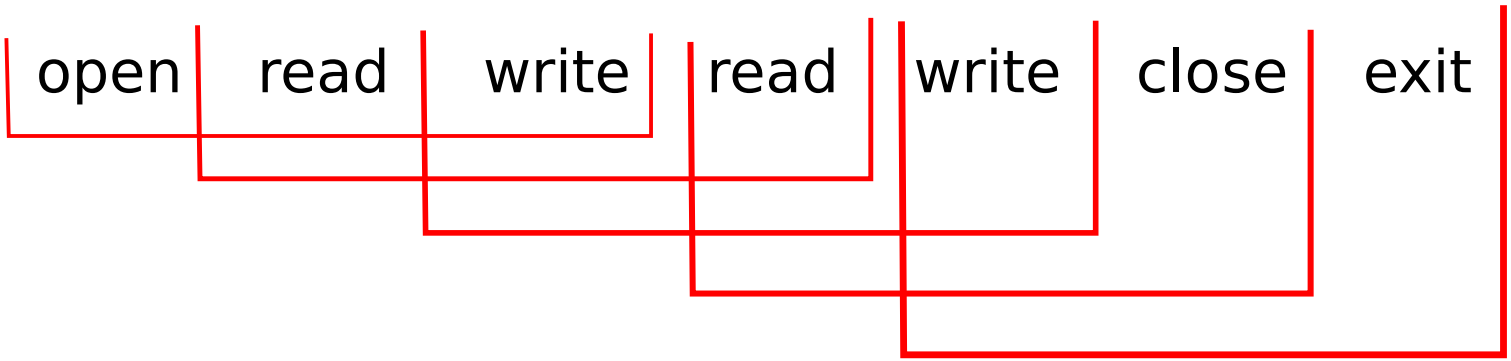
Therefore, for all i and x we have

$$\sigma_{abc}^{i}(x) = x + m(a+b) - ld.$$

for some integers m, l satisfying $|m| + |l| \leq i$.

Prior Art: stide

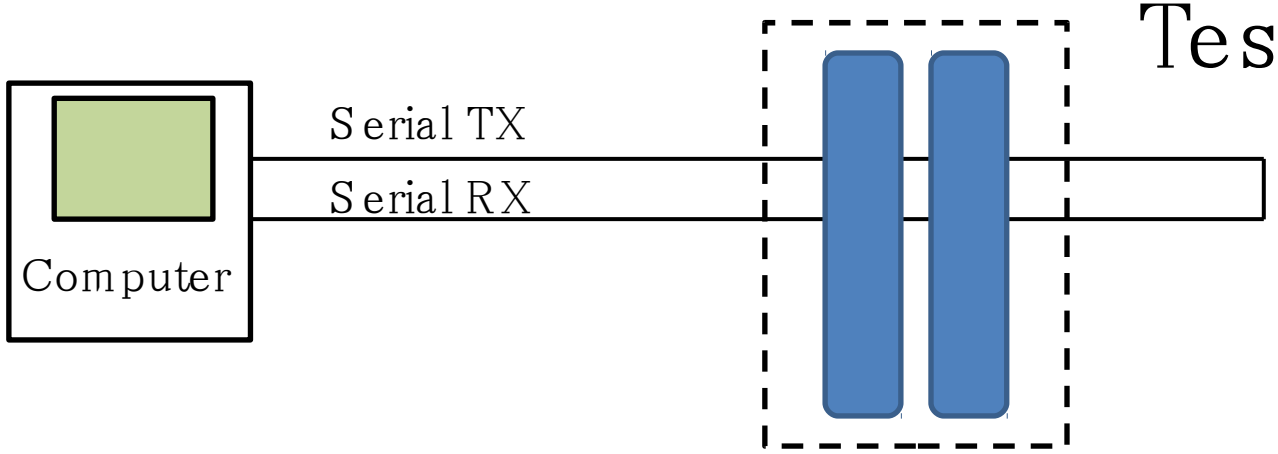
- Sequence Time-Delay Embedding
- Sequences (*n*-grams) of syscalls



- Look at rolling window of twenty sequences at a time. If enough of them are unknown, alert.

Spinner Assembly: Quantitative Testing

Setup:



Spinner Assembly rotating at 1.7 Hz

Results:

1,000,000 bytes sent; 0 errors

Error probability < 0.0000054 with 99% confidence

Conclusion:

Slip ring interface is suitable for serial data

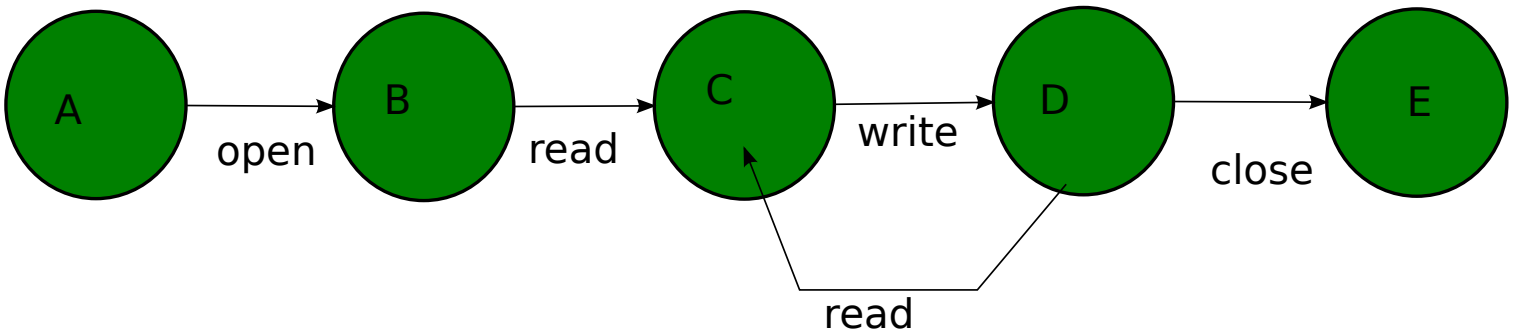
Summary

- $h = (6.348 \pm 0.0626) \cdot 10^{-34}\ \mathrm{J \cdot s}$
- $\phi = 1.76 \pm 0.026\ \mathrm{eV}$
- Photoelectric effect well described by Einstein's model
  - Linear dependence of cutoff voltage on frequency
- Particle-like nature of light

Questions?

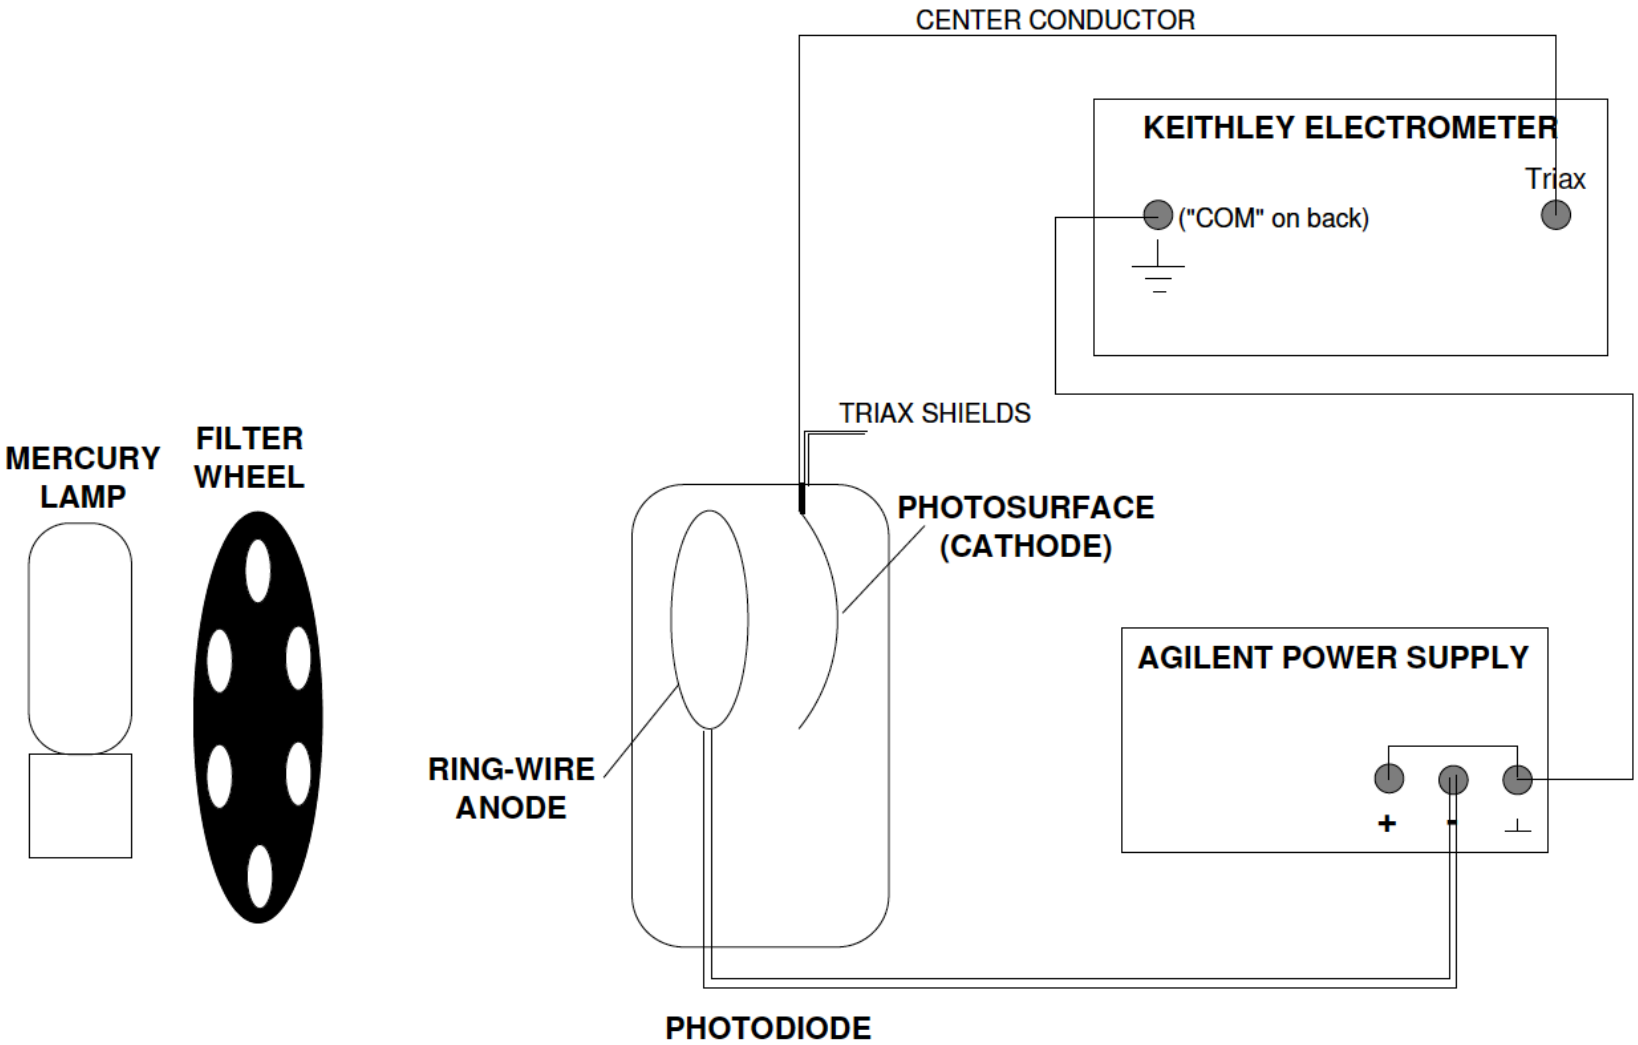
Prior Art: Finite Automata

- Maintain current "state" associated with the syscalls so far (and other info)
- Define transitions between the various states
- When the appropriate syscall is seen, transition to the appropriate new state:



- If an unfamiliar syscall is made, alert

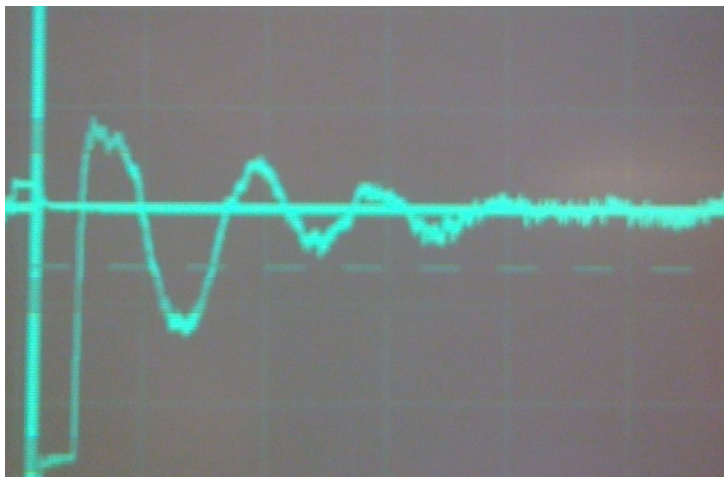
Experiment Setup

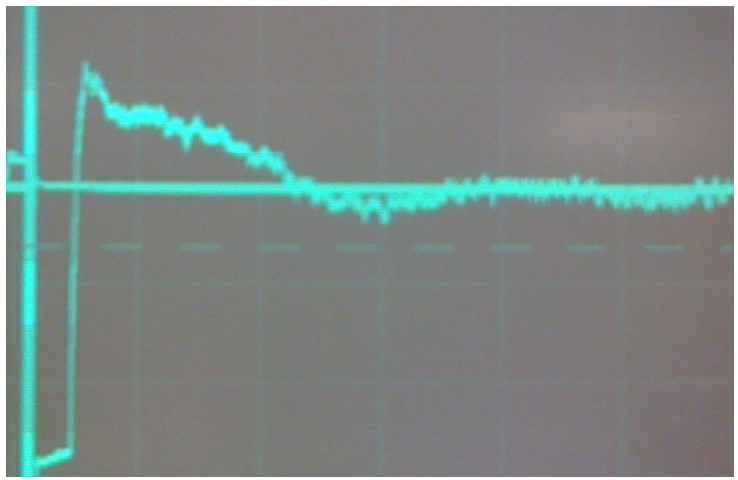


Slightly modified from experiment lab guide (`http://web.mit.edu/8.13/www/intro2.shtml`).

Finding Resonance

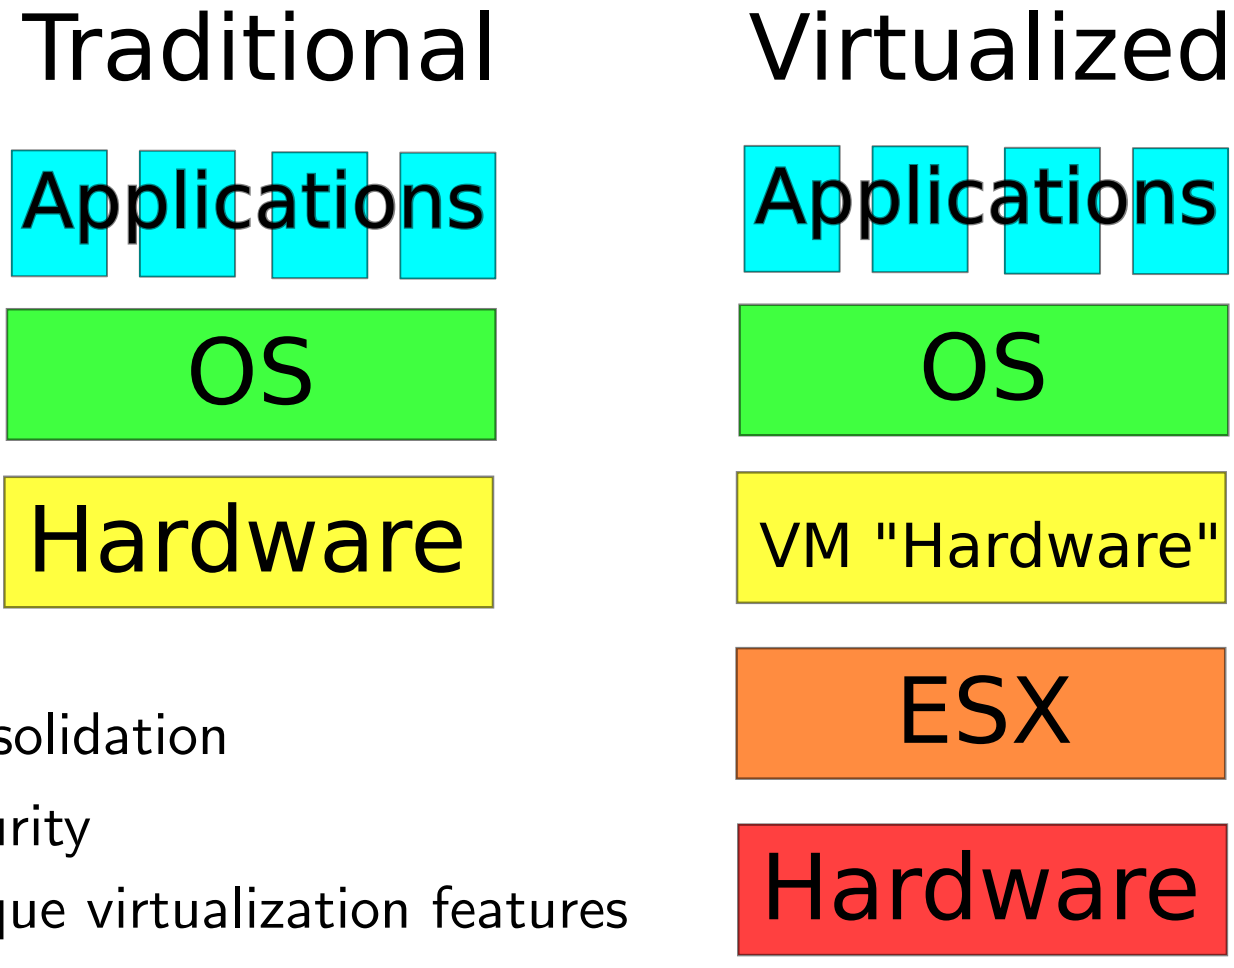
- Minimize beats
  - $\nu_{beats} = |\nu_{pulses} - \nu_{Larmor}|$





- Find most uniform B field
  - Inhomogeneity $\rightarrow$ different resonances $\rightarrow$ weaker signal
- Result: $(1.424 \pm 0.083) \cdot 10^{-26}$ J/T (3% off accepted value)

Virtualization



- Consolidation
- Security
- Unique virtualization features

Summary

- Systematic errors in amplitude data too large to allow verification of Klein-Nishina, but data definitely inconsistent with classical prediction
- Attenuation data strongly supports Klein-Nishina result over Thomson
- Necessity of relativistic quantum description of photons and electrons

Spin-Lattice Relaxation (T1)

- Return of spins to thermal equilibrium
- Energy transferred into molecular motions
- Lattice frequencies must be close to Larmor frequency

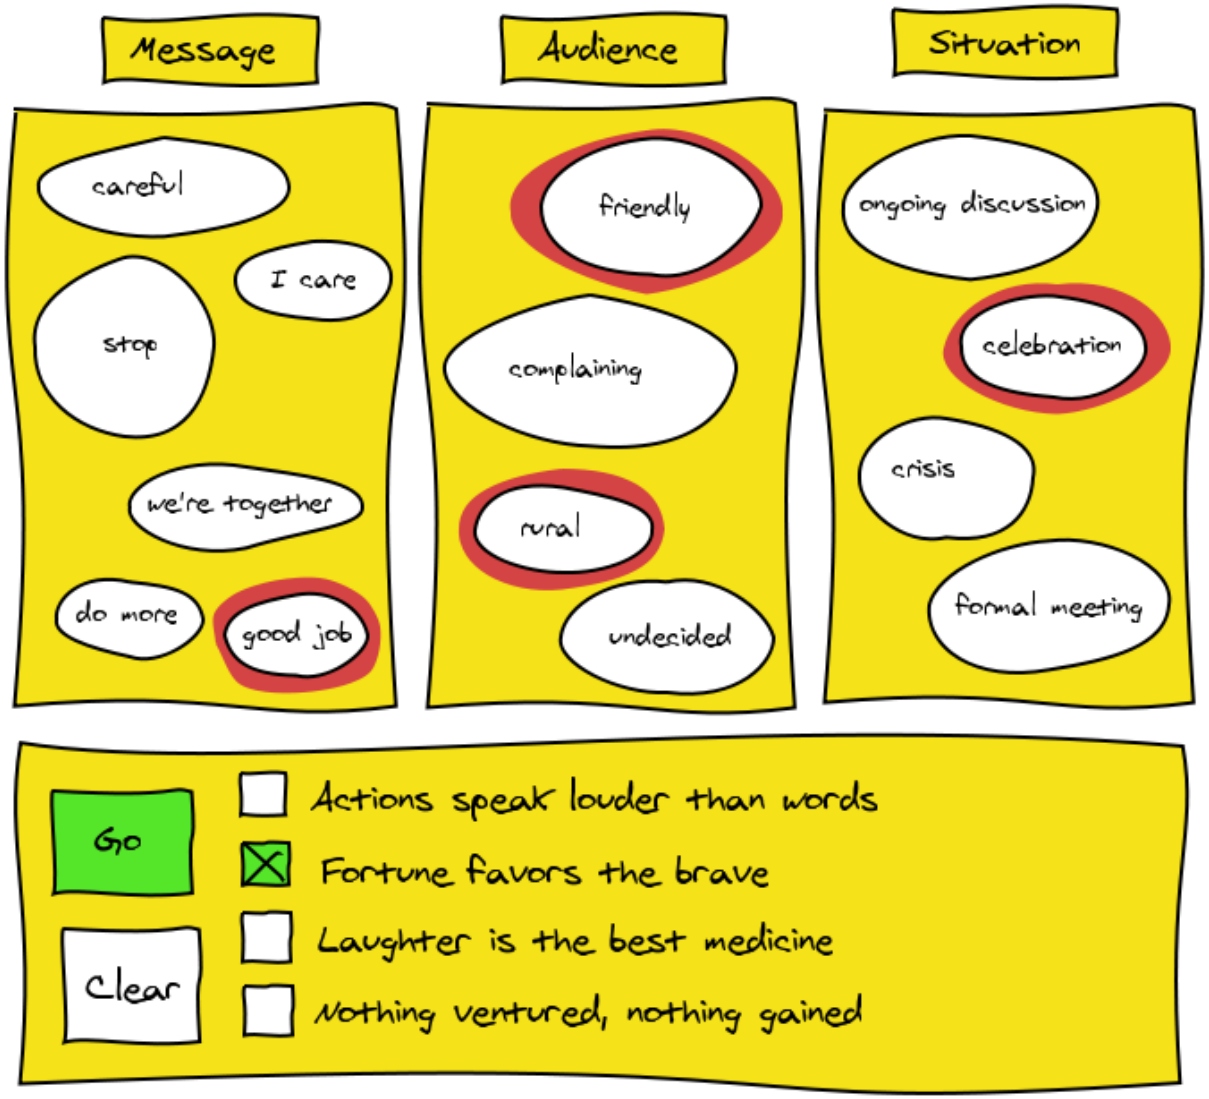
Finding Possible Proverbs



Attenuation Results

- Measured electron cross-section: $(2.50 \pm 0.025) \cdot 10^{-29}\ m^2$
  - Klein-Nishina prediction: $2.56 \cdot 10^{-29}\ m^2$ ($\approx 2\,\sigma$ off)
  - Thomson prediction: $6.65 \cdot 10^{-29}\ m^2$ ($\approx 166\,\sigma$ off!)
- Small systematic error
  - Some scattered photons detected
  - Detector drift
- Relativistic effects dominant: Klein-Nishina model much more accurate than classical Thomson model

What do we mean by “innovation”?
Purpose driven creativity

An abstract sculpture?

Creative.

An abstract sculpture that prevents the wind from spinning a building’s revolving doors too fast?

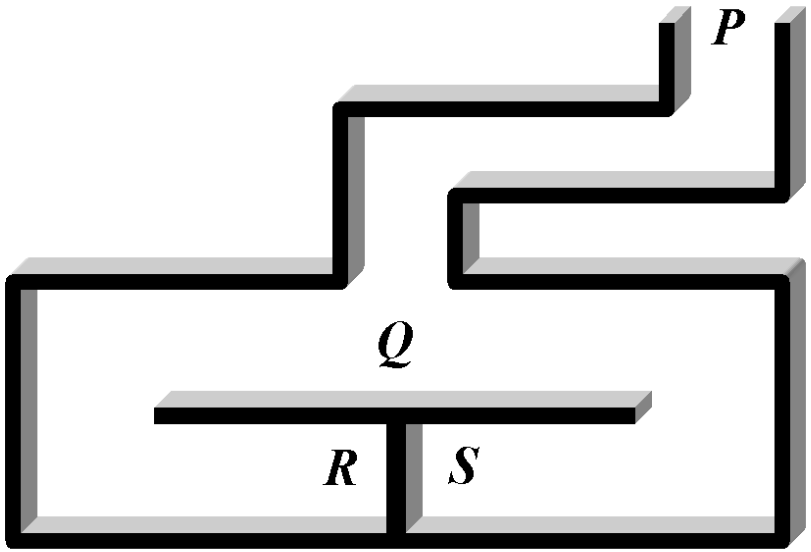
Innovative.

Summary

- Observed NMR in protons at the expected frequency
- Verified expected effects of Fe^{3+} ions on relaxation times
- Suggested usefulness of NMR in chemical analysis

Solution

- Victor stands outside at P
- Peggy vanishes into the cave and stands at R or S
- Victor comes back in, stands at Q, and calls out which side Peggy should return by
- Peggy returns as requested



General Structure

	Victor stands outside
Peggy: Prepare	Peggy vanishes into the cave
Peggy: Commit	Victor comes back in, . . .
Victor: Challenge	
Peggy: Respond	

Zero-Knowledge Proofs

Goal: Peggy (prover) wants to convince Victor (verifier) of something

Convincing If true, an honest prover can always convince an honest verifier

No cheating If false, a dishonest prover can only rarely convince an honest verifier

Zero knowledge If true, a cheating verifier cannot learn anything more than that it is true.

Stabilizing unstable systems: balance and levitation

Ideas from the classification of cycle structure, cont

To show that each residue class contains exactly one residue class, we note that if x is in a cycle of length j, then

$$\sigma_{abc}^{j}(x) = x + m(a+b) - ld = x.$$

and $m + l \leq j$.
We show that $\lceil \frac{n}{k} \rceil / 2 < j$.

Questions?

- History of Compton Scattering
- Scattering Theory
- Amplitude Experiment
- Attenuation Experiment

Idea of the construction of $\mathbf{p}_k(n)$, cont

Then

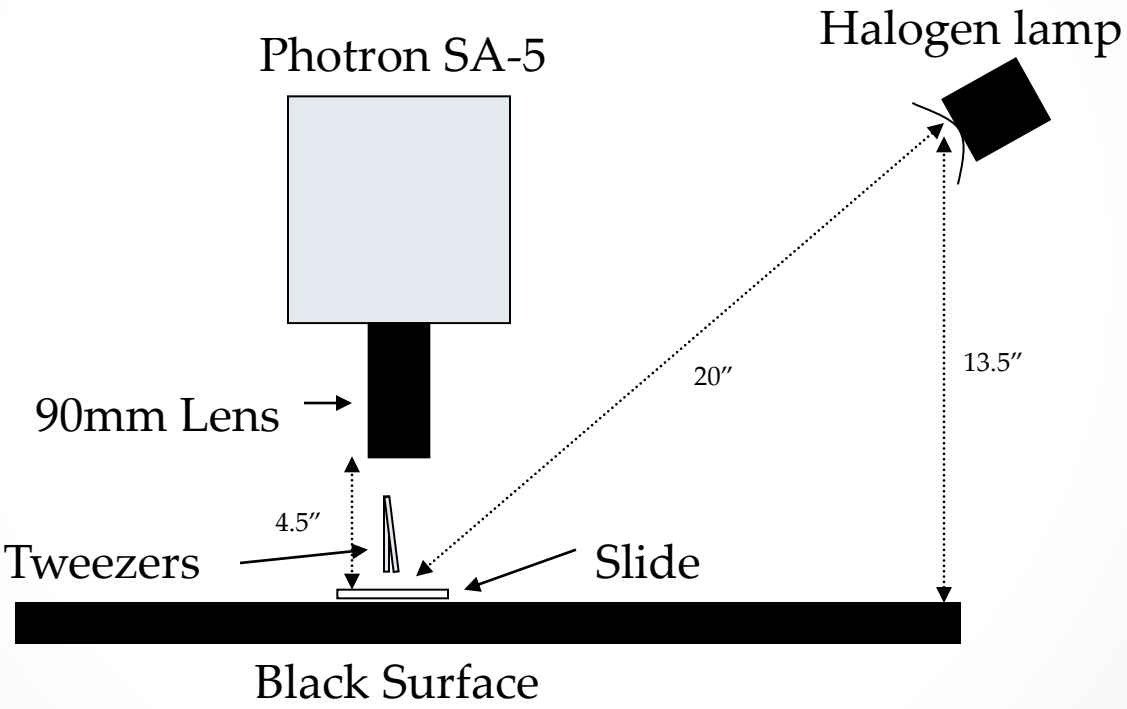
$$\mathbf{p}_k(n) = f(n,k) \cdot Pr(B_k \text{ given } A_k).$$

If $n \mid k$, we have that $k \mid (a+b)$ and $(b+c)$ implies that $k \mid a, b, c$. Then choosing the blocks a, b, c partitioning n is equivalent to choosing blocks $a/k, b/k, c/k$ partitioning n/k.

Then $Pr(B_k \text{ given } A_k) = \mathbf{p}(n/k)$, so

$$\mathbf{p}_k(n) = f(n,k)\mathbf{p}(n/k).$$

Procedure: overhead setup



Limit of $\mathbf{p}_k(n)$

Theorem

We have

$$\lim_{n\to\infty} \mathbf{p}_k(n) = \frac{1}{k^2}\frac{6}{\pi^2}.$$

This is actually useful!

Applications

- Polymer formation
- Cell behavior
- Statistical mechanics
- Financial modeling
- Societal evolution
- Data compression
- Music

- Energies independent of intensity
- But dependent on frequency!

Understanding

- Einstein's explanation (1905)
- Light quanta with $E \propto \nu$
- Millikan's experiments (1912-5)

Conclusion

- Security becoming increasingly important
- Host-based intrusion detection vulnerable to the agent being attacked
- Project: *Enhance effectiveness of intrusion detection systems by moving the vulnerable agent onto the host, and use vprobes to look inside the VM*
- Extensive literature exists on how to examine the data the agent/vprobes gather

abc-permutations

Definition

Let *abc*-permutations be elements of S_n obtained by partitioning $[n]$ into three blocks of length a, b, c and exchanging the first and last blocks.

Proof of classification of *abc*-permutations

Assume that σ is reverse layered and avoids 4321. Then it has at most three layers, so it is an *abc*-permutation.

Now assume that σ is an *abc*-permutation. Then it is reverse layered, so it avoids 132, and 213. It also has at most three layers, so it avoids 4321.

Questions?

- History of Ramsauer-Townsend
- Scattering
- Matter Waves
- Dependence of cross section on energy

Results and Errors

- $h = (6.348 \pm 0.0626) \cdot 10^{-34}\ \mathrm{J \cdot s}$
  - $\approx$ 4.2% off of true value ($\approx$ 4.5 times estimated error)
- $\phi = 1.76 \pm 0.026\ \mathrm{eV}$
  - $\approx$ 23% off of true value ($\approx$ 21 times estimated error)

- Random Errors
  - Precision of instruments
  - Small compared to...
- Systematic Errors
  - Ambient light
  - Light striking the anode
  - Cutoff voltage bias
  - Variation of ϕ

- Various possibilities for systematics, but probably not due to measurement error
- Disparity in error makes some possibilities less likely

Single-process browsing

Chrome browser process

Work of Pak and Redlich

In 2008, Pak and Redlich investigated the probability that an *abc*-permutation of length n is a single n-cycle in order to answer a question posed by V. I. Arnold.

Theorem (Pak-Redlich, 2008)

Let σ_{abc} be an abc-permutation. Then σ_{abc} is a long cycle if and only if

$$\gcd(a+b, b+c) = 1.$$

Background: crystallization

- Crystallization refers to the formation of solid crystals from a homogeneous solution.
- It is essentially a solid-liquid separation technique and a very important one at that.
- Solubility - Hot liquid dissolves more compounds. Once cooling process starts, compounds become crystals

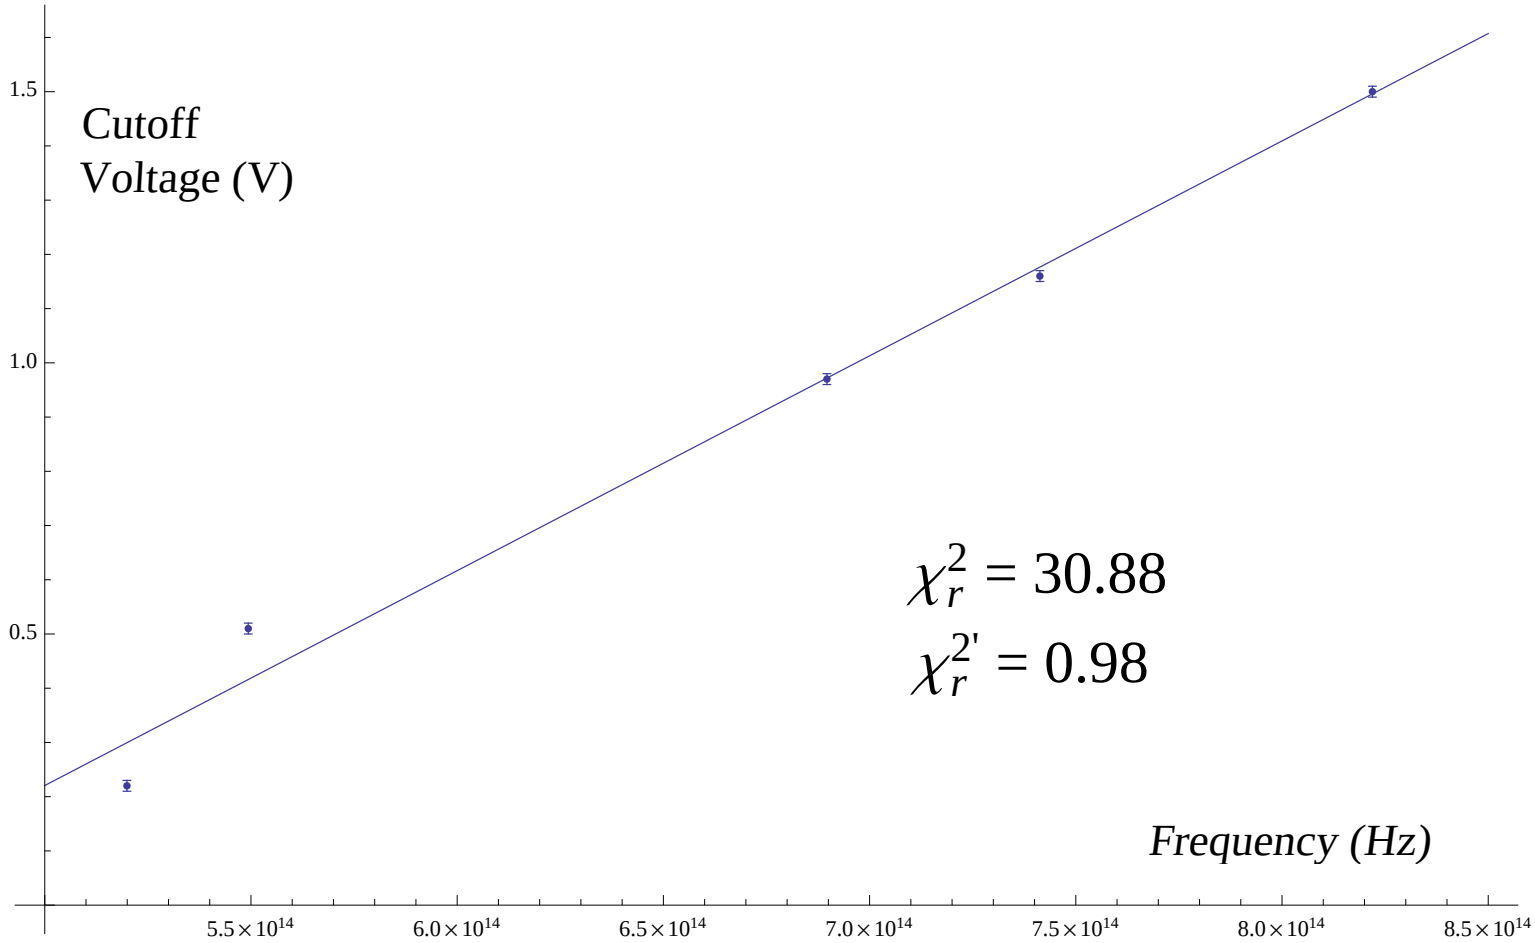
Cycle structure of *abc*-permutations

We fully characterize the cycle structure of *abc*-permutations.

Theorem

Let $k = \gcd(a+b, b+c)$. *Then* σ_{abc} *is composed of* k *cycles of lengths* $\lfloor \frac{n}{k} \rfloor$ *and* $\lceil \frac{n}{k} \rceil$. *These cycles correspond to the residue classes of* n *modulo* k.

Cutoff Voltage vs. Frequency



- Large χ^2 for small ν
- However, near-linear relationship as expected

Ideas from the classification of cycle structure, cont

Therefore, for all i and x we have

$$\sigma_{abc}^{i}(x) = x + m(a+b) - ld.$$

for some integers m, l satisfying $|m| + |l| \leq i$.

Let $k = \gcd(a+b, d) = \gcd(a+b, b+c)$. Then the orbit of x under σ_{abc} will stay within one residue class modulo k.

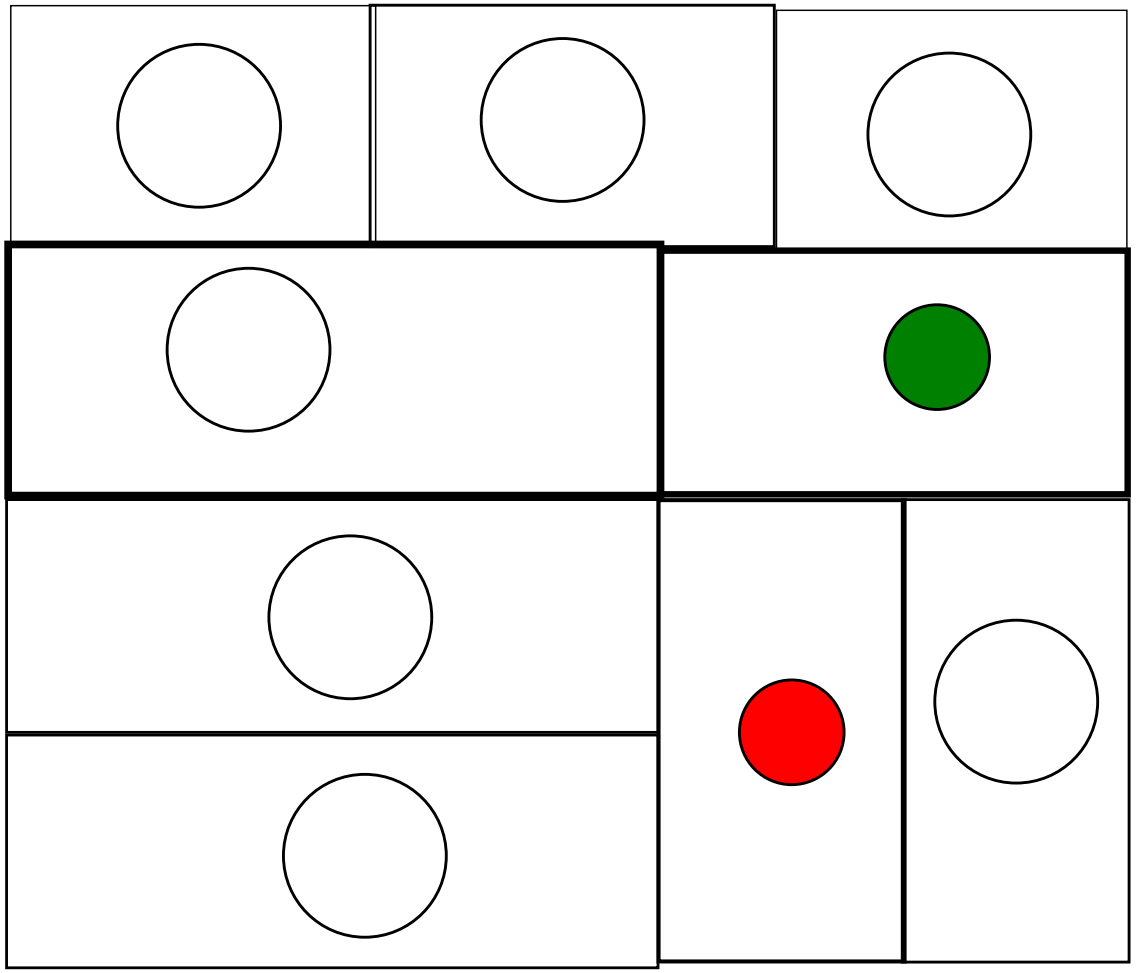
Respond



Idea of the construction of $\mathbf{p}_k(n)$, cont

Then

$$\mathbf{p}_k(n) = f(n,k) \cdot Pr(B_k \text{ given } A_k).$$

Risks

Big risk: schedule slippage Room to cut in both the exploit finding/writing and the analyzers

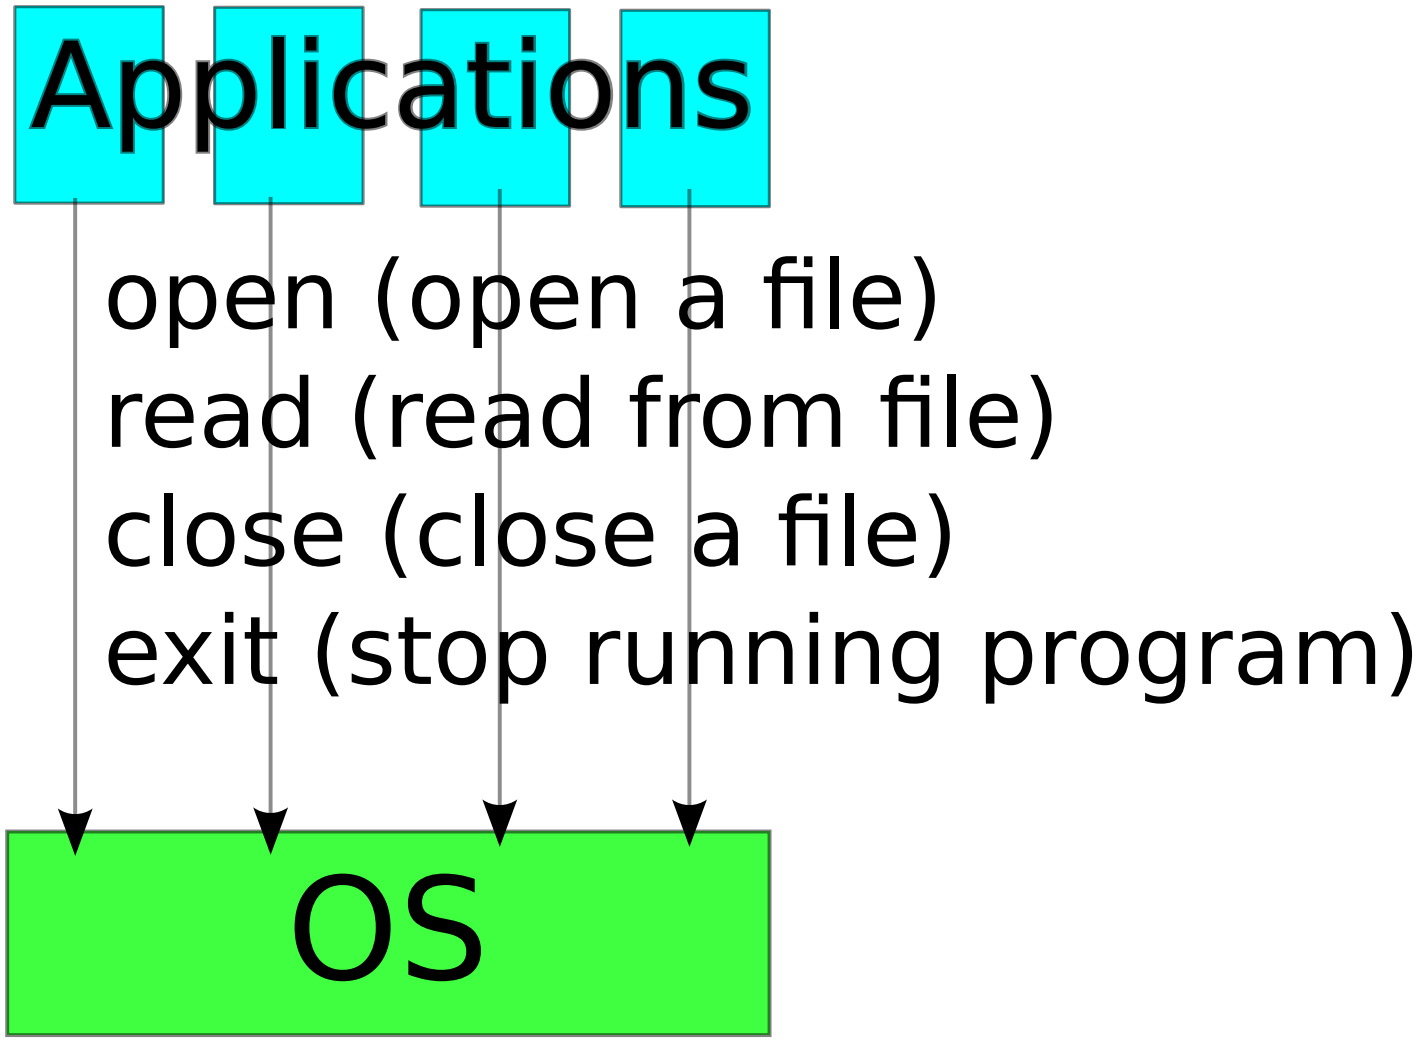
Can't come up with a novel analyzer Not key to the project. The main novelty is supposed to be in the vprobes component, anyway.

vprobes not powerful enough My team is the vprobes team. We can probably add required features.

Enforcing security

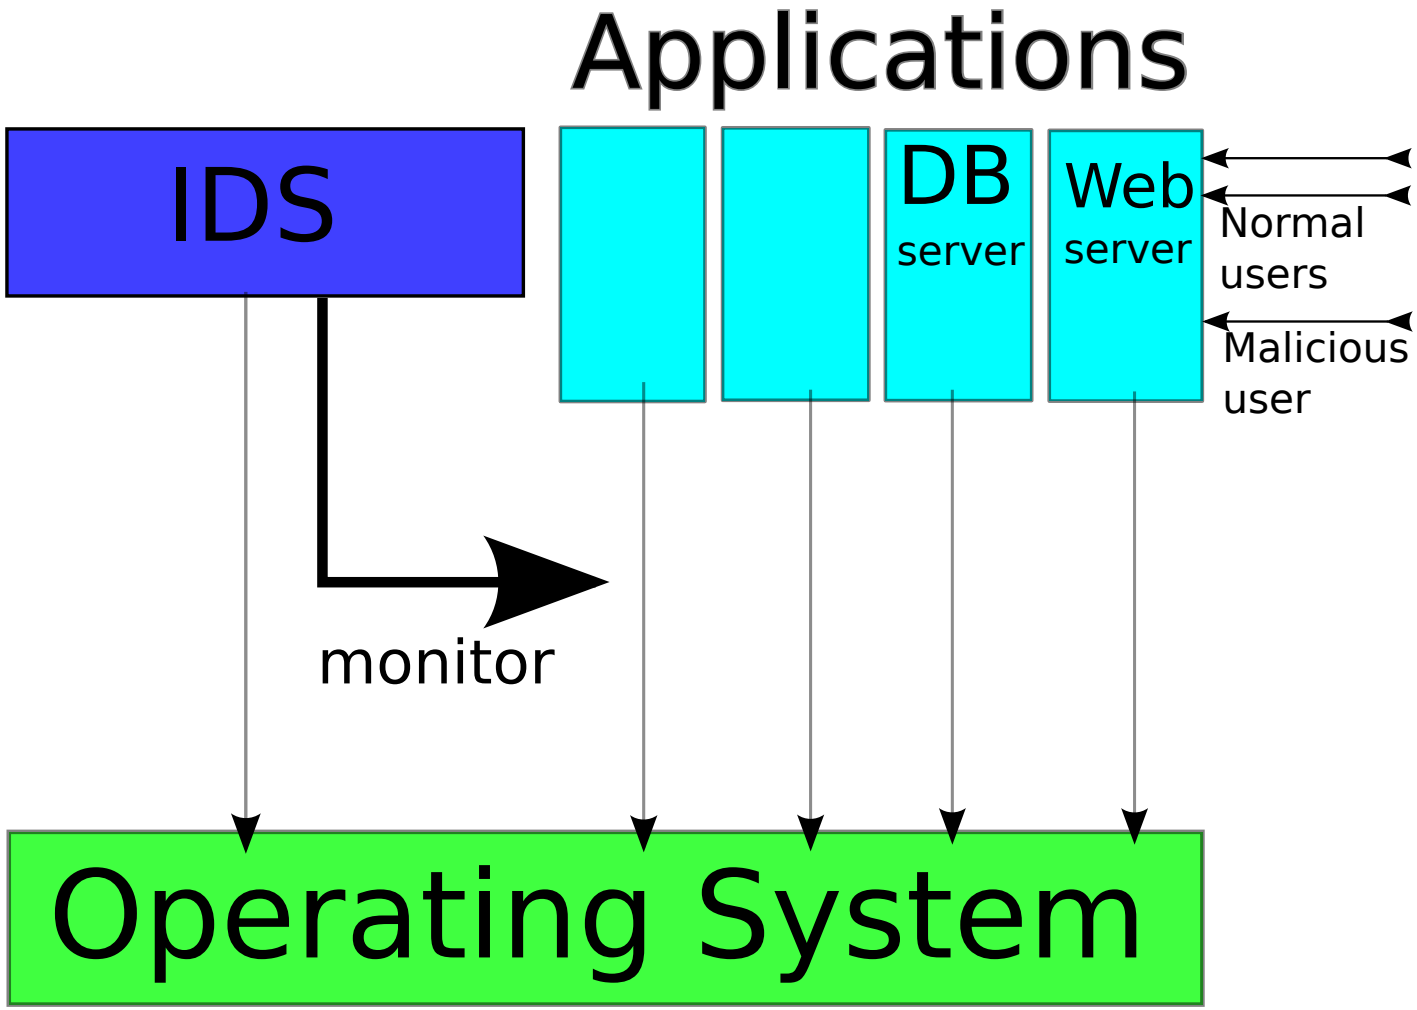
- Sandbox each renderer
  - Can't access files
  - Internet
  - Other processes
- Only communicate with browser
  - Performs privileged actions on behalf of renderer
  - Including network access

System calls (syscalls)



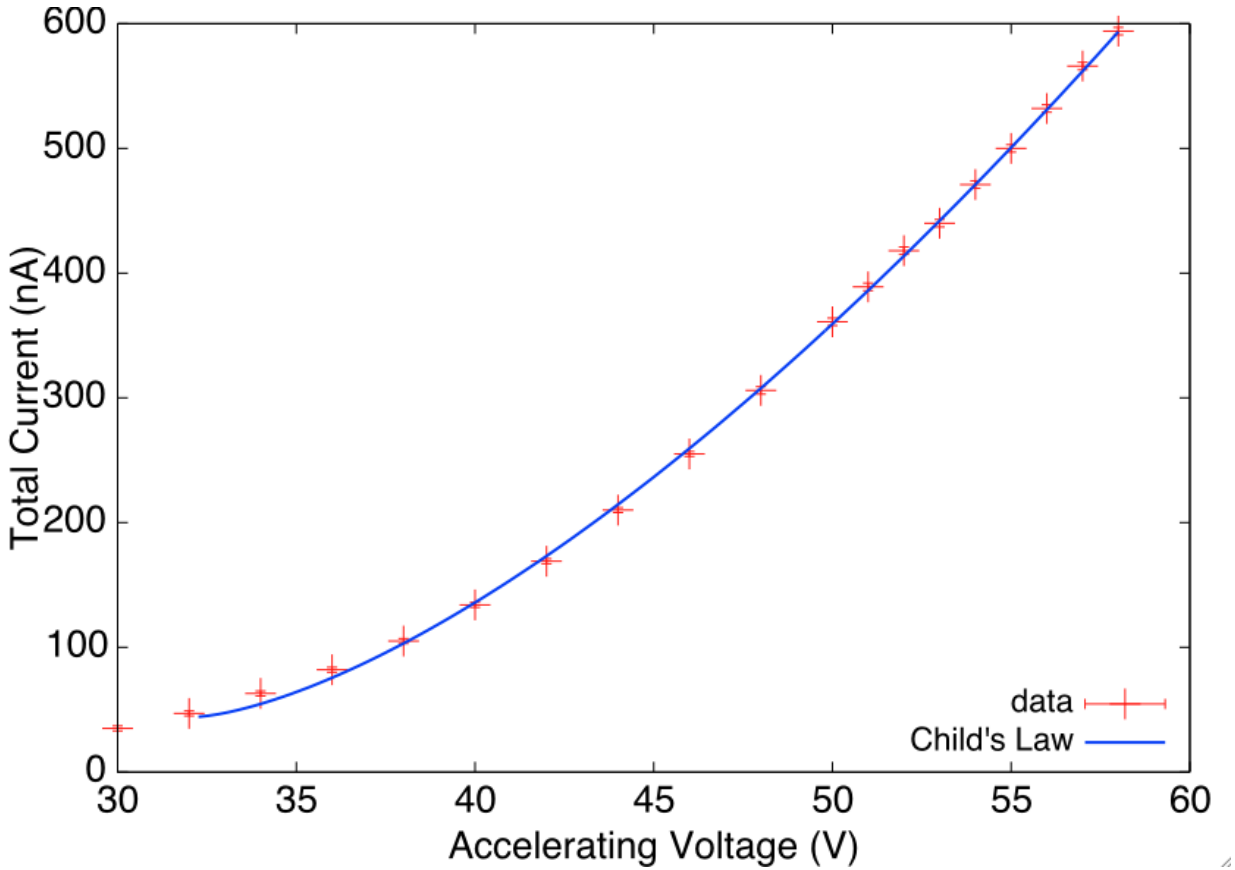
Intrusion detection

- Rich variety of work involving host-based intrusion detection
- Many based on patterns of system calls



Child's Law

- $I \propto V^{\frac{3}{2}}$



$$\chi_r^2 = 4.59$$

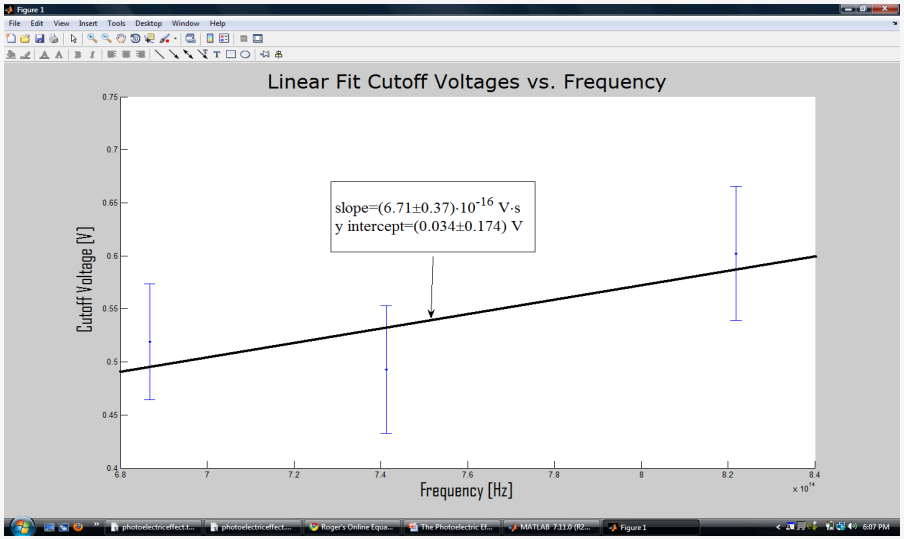
Results

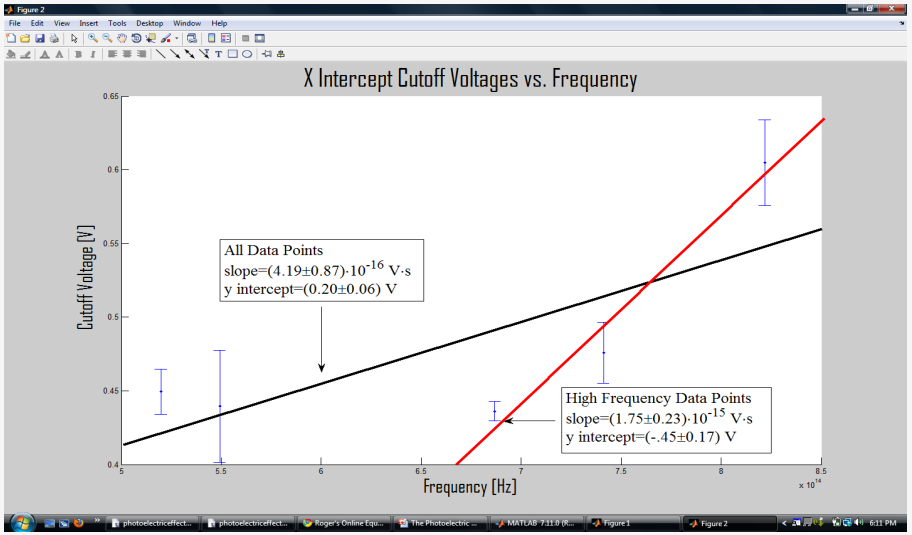
Solidified bismuth drop. Drop was melted in a spoon then poured onto a slide. The line across the middle of the image is the edge of the slide that the drop landed on. Many colors are visible along the various surfaces. f/36, 90mm lens.

Improvements and Extensions

- Additional experiments to determine contact potential and initial electron energy
- Collect more data in vicinity of minimum σ
- Determine voltage necessary to get equal filament temperatures

Graphical Results





Work of Pak and Redlich

In 2008, Pak and Redlich investigated the probability that an *abc*-permutation of length n is a single n-cycle in order to answer a question posed by V. I. Arnold.

Theorem (Pak-Redlich, 2008)

Let σ_{abc} be an abc-permutation. Then σ_{abc} is a long cycle if and only if

$$\gcd(a+b, b+c) = 1.$$

Theorem (Pak-Redlich, 2008)

Let $\mathbf{p}(n)$ be the probability that an abc-permutation of length n is a long cycle. Then

$$\lim_{n\to\infty} \mathbf{p}(n) = \frac{6}{\pi^2}.$$

Reverse layered permutations

Definition

A permutation ϕ is called reverse layered if it is of the form $q_1 q_2 \dots q_k$, where the q_i are strings of consecutively increasing numbers and $q_i > q_j$ if $i < j$.

Lemma (Monsour, 2002)

The set of reverse layered permutations is the set of 132 *and* 213 *avoiding permutations.*
